DHIA

SIRE SUMMARY LIST

APRIL 1967

PART I.

U. S. DEPT. OF AGRICULTURE
NATIONAL AGRICULTURAL LIBRARY

SEP 12 1968

CURRENT SERIAL RECORDS

**✓ AYRSHIRE, GUERNSEY, JERSEY,
BROWN SWISS, MILKING SHORTHORN,
RED DANE, AND RED POLL SIRES ✓**

**Agricultural Research Service
U. S. Department of Agriculture**

This DHIA Sire Summary List consists of evaluations of all bulls that had enough DHIA progeny on record in the USDA master files on December 1, 1966. Additional conditions were that:

- 1, At least 10 progeny calving since January 1, 1950 had one or more herdmates;
- 2, The DHIA records of at least half the progeny show their first lactation began at an age of less than 36 months; and
- 3, The sire was not summarized in either of the two subsequent summaries dated May and September 1967.

This Summary is intended to be used as a reference document. The large number of pages made it necessary to publish this issue of the Sire Summary in two parts, as follows: Part I (334 pages) is the summary of Ayrshire, Guernsey, Jersey, Brown Swiss, Milking Shorthorn, Red Dane, and Red Poll sires; and Part II (402 pages) is that of Holstein sires. This seemed to be the most effective split from a mechanical standpoint.

The sire evaluations summarized in this publication are appraisals based on information about the production performance of progeny obtained by USDA's Agricultural Research Service from Dairy Herd Improvement Associations (DHIA) that are affiliated with the National Cooperative Dairy Herd Improvement Program. This program is described in detail in U.S. Department of Agriculture Handbook No. 278, "National Cooperative Dairy Herd Improvement Program Handbook", copies of which can be obtained from the Office of Information, U.S. Department of Agriculture, Washington, D. C. 20250.

The DHIA Sire Summary List is revised and updated as improved techniques are developed to furnish its members with more accurate evaluations of sires of DHIA cows.

DHIA SIRE SUMMARY LIST APRIL 1967

PART I

Ayrshire, Guernsey, Jersey, Brown Swiss, Milking Shorthorn,
Red Dane, and Red Poll Sires

INTRODUCTION

This DHIA Sire Summary List contains information for 1,292 Ayrshire, 6,798 Guernsey, 4,722 Jersey, 1,055 Brown Swiss, 335 Milking Shorthorn, 18 Red Dane, and 2 Red Poll sires and their daughters.

These sire summaries are based on DHIA records that were available to USDA on December 1, 1966 and those that met the conditions described on the facing page.

All production records used in DHIA sire summaries consist of lactation records of 305 days or less that have been standardized to a mature-equivalent (M.E.), twice-a-day milking basis. The age factors used in standardizing these records were stratified by geographical region of the United States and by season. (See Dairy Herd Improvement Letter, February 1967.) Separate adjustment factors were used for milk and milk fat. When more than one lactation is available for a cow, all records for both the daughters and her herd-mates are averaged and used to represent her performance.

Incomplete records that are reported as having been terminated because the cow aborted, was culled for low production, or was sold for nondairy purposes were projected to a 305-day basis by factors that allow for breed, age, milk, and milk fat and were used in compiling sire summaries. (See Dairy Herd Improvement Letter, August 1965.) Records that were deleted and not used in compiling summaries were (1) those coded as complete but less than 180 days in length, (2) those coded as incomplete but less than 15 days in length, (3) those estimated for two or more consecutive test periods,

and (4) those initiated by abortion. However, incomplete records may not be included for cows that calved before 1959.

The lactation records used in these sire summaries had calving dates prior to December 1, 1965.

COMPILATION OF SIRE SUMMARY

The herdmate, or contemporary, comparison is useful because it removes from the evaluation of a sire's breeding value complications arising from herd, year, and season-of-calving variations in production. Herd-year-seasons are based on a 5-month moving average. The appropriate herdmate average for the daughter of the sire is obtained by averaging all records of daughters of other sires calving in the herd in the same month as the daughters, in the previous 2 months, and in the succeeding 2 months (i.e., the same herd-year-season). For example, the herdmate average for a sire's daughter that calved in March is obtained by averaging the production of all cows, except her paternal sisters, that calved in that herd from January through May. All comparisons included in these summaries are on a within-breed basis.

Because the usefulness of the herdmate average is dependent in part on the number of herdmates available, the herdmates' production is adjusted to place the herdmate data of the daughters on a more comparable basis. For each individual lactation of a sire's daughter, the herdmates' average is adjusted as follows:

$$AHMA = \text{Reg. brd-yr-sea. avg.} + \frac{NHM}{NHM + 1} (\text{HM avg. minus Reg. brd-yr-sea. avg.})$$

where AHMA = Adjusted herdmate average

Reg. brd-yr-sea. avg. = Regional breed-year-season average

NHM = Number of herdmates

HM = Herdmate average

The regional breed-year-season averages are calculated from the 2X, 305-day, M.E. DHIA records of cows calving from January 1, 1950, to December 1, 1965. Three regional groupings were used

for Ayrshire and Brown Swiss, four for Guernsey and Jersey, and 14 for Holstein. The averages for Milking Shorthorn, Red Dane, and Red Poll are based on all cows calving in the United States for the year-season in question. The primary cause of differences in the number of regions used for each breed was the number of available lactations. The States comprising each region are shown in table 1 of the Appendix.

The measure of breeding merit used in these summaries is the Predicted Difference. This value is the expected deviation of a bull's progeny from their herdmates in breed average herds. The Predicted Difference (PD) is computed as follows:

$$PD = \frac{N h^2}{4 + (N-1) h^2 + 4 \frac{\sum n_i (n_i - 1)}{N}} \frac{[(\text{Dau. Avg.} - \text{AHMA}) + 0.1(\text{AHMA} - \text{Breed Avg.})]}{c^2}$$

Adjust- ment for number of daughters	Adjust- ment for distribu- tion of daughters over herds	Environ- mental correlation	Adjustment for herd environment and number of herdmates	Adjustment for herd genetic level
---	--	-----------------------------------	---	---

where: N = Total number of progeny of the bull

n_i = Number of progeny in the i^{th} herd

h^2 = Heritability of milk yield from paternal half-sib estimates in nationwide populations

c^2 = Residual environmental correlations among half-sibs in the same herd after they are expressed as deviations from herdmates

AHMA = Adjusted herdmate average; Daus.= daughters; and Avg.= average

The value w_j will be substituted for N when some daughters have more than one record,

$$\text{where: } w_j = \frac{n_j R}{R [1 + (n_j - 1) R]} = \begin{matrix} 1.00 \text{ for one record;} \\ 1.33 \text{ for two} \\ 1.50 \text{ for three records; etc.} \end{matrix}$$

R = Repeatability of individual records
= 0.50

n_j = Number of records on the j^{th} cow

The breed average is compiled from all DHIA cows of the respective breed that calved in 1963 and 1964. These averages are shown in the following tabulation:

<u>Breed</u>	<u>Milk^{1/}</u> <u>Lb.</u>	<u>Fat^{1/}</u> <u>Lb.</u>	<u>Breed</u>	<u>Milk^{1/}</u> <u>Lb.</u>	<u>Fat^{1/}</u> <u>Lb.</u>
Ayrshire-----	10,546	426	Brown Swiss-----	11,689	477
Guernsey-----	9,153	436	Milking Shorthorn-	9,204	345
Holstein-----	13,357	487	Red Dane-----	11,397	454
Jersey-----	8,414	429	Red Poll-----	7,904	316

1/ 2X, 305-day, mature-equivalent.

The precision with which a Predicted Difference will predict the true breeding merit of an individual bull, relative to other bulls of that breed, depends on many factors. The major variables that affect precision are:

- (1) Number of daughters in the summary;
- (2) Number of herds in which the daughters are located;
- (3) How the daughters are distributed through these herds; and
- (4) Number of lactations per daughter in the summary.

The accuracy of predicting a bull's true breeding merit increases as additional daughters and herds are added. The more uniformly the progeny are distributed through the herds represented, the more repeatable the summary becomes. Ability to measure the true daughter deviation in breed average herds increases as the number of lactations per daughter increases. Examples of Repeatability for different combinations of numbers of daughters per herd are shown in figure 1.

The measure of precision in the Predicted Difference used in this publication is the Repeatability of the sire summaries, which is computed as follows:

$$\text{Repeatability of a sire summary} = \frac{N h^2}{4 + (N-1) h^2 + 4 \frac{\sum n_i (n_i - 1)}{N} c^2}$$

where: N = Number of daughters in the summary. The value of w_j , as explained previously, is substituted for N when some daughters have more than one lactation.

h^2 = 0.19 and is the heritability of milk production as developed from nationwide samples of records.

$\frac{\sum n_i (n_i - 1)}{N}$ = The adjustment for distribution of daughters through the herds represented in the sire summary.

n_i = Number of daughters in each herd. If a bull had nine daughters in herd 1, and six daughters in herd 2, $\sum n_i (n_i - 1) = 9(8) + 6(5)$.

c^2 = 0.14 and is the relationship among half-sisters calving in the same herds because of common environment and certain genetic factors not accounted for by differences among bulls.

A low Repeatability value or confidence factor indicates that the true breeding merit of the bull involved may be appreciably different from the Predicted Difference shown for that bull in the same sire summary.

The parameters used in computing the reliability of sire summaries are based on the best research information presently available. The value of h^2 , 0.19, is the same as used by USDA in the past in the equation for adjusting summaries on AI bulls, $\frac{N}{N + 20}$. The value of c^2 , 0.14, is based on USDA research with nationwide samples of data.

The term "effective daughters" in the sire summary is not comparable to the value of the same name used in Canadian sire summaries. Instead, it is an index of the distribution of daughters over herds in terms of the distribution's effect

on the Repeatability of the sire proof. If each daughter were in a separate herd, which is the optimal distribution in terms of the repeatability or reliability of the sire proof, the "effective daughters" would be 1.0. This would be the classical AI proof, thus the lower the value for "effective daughters", the more reliable the proof for a fixed number of progeny. The formula for the effective daughters is

$$1.0 + \frac{n_i(n_i-1)}{N} \text{ where } n_i \text{ and } N \text{ are defined the same as previously shown.}$$

When each daughter is not in a different herd, the "effective daughters" indicates how they were distributed. For instance, assume that a bull has 25 progeny in 5 herds. They can be distributed in any manner from 5, 5, 5, 5, 5, to 21, 1, 1, 1, 1, but this is not shown by the number of daughters and herds. The effective daughters in the first case is 5.0, i.e., $5 \times 5(4)/25 + 1.0$, and in the second case is 17.8, i.e., $21(20)/25 + 1.0$. Any time the effective daughters deviates much from the average number of daughters per herd, most of the progeny were grouped in one or a few herds. Obviously, when a bull has many daughters in many herds, this parameter does not have much additional value in interpreting the sire evaluation. It is most useful, however, when evaluating a bull on a relatively small number of daughters in a few herds.

It has long been known that the accuracy of projecting a lactation record is proportional to the number of days in milk. This principle was used to adjust incomplete lactations in this DHIA Sire Summary List. The procedure is as follows:

$$\text{Adj. Dau. rec.} = \text{AHMA} + r_i (\text{Proj. Dau. rec. minus AHMA})$$

where: r_i = The phenotypic correlation between a record with i months in milk and a 305-day record.

Adj. Dau. rec. = Adjusted daughter record.

Proj. Dau. rec. = Projected daughter record (2X, 305-day, M.E.).

AHMA = Adjusted herdmate average.

The correlations were stratified by age, as follows:

	Months in Milk									
	<u>1</u>	<u>2</u>	<u>3</u>	<u>4</u>	<u>5</u>	<u>6</u>	<u>7</u>	<u>8</u>	<u>9</u>	<u>10</u>
2-yr-old cows	.72	.83	.88	.92	.94	.96	.97	.98	.99	1.00
Older cows	.60	.74	.82	.86	.91	.93	.96	.98	.99	1.00

Thus, for example, a 2-year-old cow with a record of from 15 to 46 days in milk would receive only 72 percent as much weight as one that had completed a lactation. A record of 120 days or more (4 months in milk) is given practically the same weight as a complete record.

INTERPRETATION OF SIRE SUMMARY

The contemporary herdmate comparisons used in the USDA-DHIA Sire Summaries are especially effective in reducing environmental influences arising from herd, year, and season of calving. The primary purpose of the summaries is the use of Predicted Differences to evaluate bulls on the basis of estimated breeding value or transmitting ability for milk and butterfat yield.

Sire evaluations are based on the most reliable statistical methods available, but their usefulness for ranking bulls may be seriously limited when the Repeatability value, or "confidence factor," is less than 50 percent. When the Repeatability value is less than 50 percent the summary needs to be supplemented with additional information from the herd(s) in which the sire's daughters made their records.

Situations that are likely to cause sire summaries to represent inaccurately the true transmitting ability of the sire are (1) daughters receiving feed and management that are different from their herdmates, (2) daughters of only one or a few bulls represented among herdmates, and (3) none or few herdmates of the same age as the daughters of the bull in question.

The greater the Repeatability value or "confidence factor" of a summary, the greater the probability that the Predicted

Difference reflects the true transmitting ability of the bull for milk and fat yields.

The choice between two bulls with similar Predicted Differences involves less gamble when the bull with the higher Repeatability value is selected. However, caution should be used in predicting a bull's potential based on a single or a few matings, regardless of the Repeatability value.

Additional tabular information that supports the Summary is in the Appendix at the end of the publication.

When a bull is in an AI stud, the DHIA Sire Summary List shows the sire's AI stud No., or the last organization that owned the summarized sire. The list of AI organizations that have operated in the United States in recent years is shown in appendix table 2, which has been compiled from reports received by ARS, Animal Husbandry Research Division. Some organizations listed in table 2 may no longer exist but are referred to because the sires they owned are summarized. Please refer to the May 1967 DHIA Sire Summary List for a list of the AI studs that are currently operating. The AI State and organization codes together make up the sire's stud identification number. See appendix table 3.

APPENDIX

TABLE 1.--Grouping of States used in regional breed-year-season averages ^{1/}

REGION NUMBER	STATES
<u>GUERNSEY AND JERSEY</u>	
1	Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania
2	Indiana, Illinois, Ohio, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas
3	Delaware, Maryland, Virginia, West Virginia, Kentucky, Tennessee, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Arkansas, Oklahoma, and Texas
4	Idaho, Wyoming, Montana, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, California, Alaska, and Hawaii
<u>HOLSTEIN</u>	
1	Maine, New Hampshire, Vermont, Massachusetts, and Rhode Island
2	Connecticut and New York
3	New Jersey and Pennsylvania
4	Indiana and Illinois
5	Ohio and Michigan
6	Wisconsin
7	Minnesota
8	Iowa and Missouri
9	North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, and Texas
10	Delaware, Maryland, and Virginia
11	Kentucky, Tennessee, North Carolina, and West Virginia
12	South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Arkansas
13	Idaho, Wyoming, Montana, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, Alaska, and Hawaii
14	California
<u>AYRSHIRE AND BROWN SWISS</u>	
1	Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Idaho, Wyoming, Montana, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, California, Alaska, and Hawaii
2	Indiana, Illinois, Ohio, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas
3	Delaware, Maryland, Virginia, West Virginia, Kentucky, Tennessee, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Arkansas, Oklahoma, and Texas

^{1/} Nationwide averages were used for the Milking Shorthorn, Red Dane, and Red Poll breeds because of the limited number of observations available.
